### PROJECTS

Main project : Fabrication of electric hybrid car

A hybrid car that runs on IC engine and also electric motor was fabricated. Our hybrid car was a rear engine rear wheel drive. In the case of an electric motor, a high volt dc motor was used to power the car through the source of electrically charged battery. Generally, this motor is fixed to the rear drive shaft which is then connected to the rear differential to power the wheels. The goal of our project was to improve efficiency, decrease the fuel cost relative to mileage and control the pollution effects. This hybrid vehicle model combined the internal combustion engine of a conventional vehicle with the battery and electric motor of an electric vehicle, resulting in twice the fuel economy of conventional vehicles.
